

MantisBT Checkpoint: Bug Report Documentation

Date: 28 September 2026

Name: James Njange

Tool: MantisBT 2.28.4 (local installation)

Issue link: <http://localhost/mantisbt-2.28.4/view.php?id=1>

Objective

Create a bug report in MantisBT, assign it to a team member, track its status through to resolution, and close it with notes at each stage.

1. Login and project setup

I signed in to MantisBT as **administrator**. The tracker had no project, and MantisBT does not allow issues to be logged until one exists, so I opened Manage, then Projects, then Create New Project (manage_proj_create_page.php) and added the following project.

Field	Value
Project name	Web Application QA
Status	development
View status	public
Description	Project for tracking bugs found during testing of the web application.

2. Bug report

I opened Report Issue and filled in the form. The issue was created as issue 0000001.

Field	Value
Summary	Error when logging in with valid credentials
Category	General
Reproducibility	always
Severity	major
Priority	high
Assigned to	administrator

Description entered in the report

When a registered user enters a valid username and password on the login page and clicks Login, the page shows an "Unexpected error, please try again" message instead of opening the

dashboard.

Steps to reproduce

1. Open the application login page.
2. Enter a valid username and password.
3. Click the Login button.
4. Observe the error message. The user is not logged in.

Expected result: The user is authenticated and redirected to the dashboard.

Actual result: An error message is displayed and the user stays on the login page.

Environment: Windows 11, Google Chrome (latest), application running on localhost.

Frequency: Reproducible every time.

3. Assignment

The bug was assigned to **administrator**, which was the only account in this installation, so the reporter and assignee are the same person. Because the bug was assigned at creation, MantisBT moved its status from new to assigned automatically. MantisBT has no status called "In Progress"; assigned is the equivalent state.

4. Tracking progress

While the bug was assigned, I added a note recording that work had started.

Note 0000001: Started investigating. Reproduced the login error on Chrome/Windows 11. Checking the authentication handler and server logs for the cause.

5. Resolution

I changed the status to resolved with the resolution set to fixed, and added a note describing the solution.

Note 0000002: Fixed the login handler: the session was not initialised before the credentials check, which caused the error. Corrected the authentication code and retested with valid credentials; the user now reaches the dashboard.

6. Closing the bug

After confirming the fix, I closed the issue and added a closing note.

Note 0000003: Verified the fix: logging in with valid credentials now opens the dashboard on Chrome/Windows 11. No further errors observed. Closing the issue as resolved.

Status history

Time	Change
15:50	New issue created; status new to assigned; assigned to administrator
15:50	Note 0000001 added (investigation started)

15:51	Status assigned to resolved; resolution open to fixed
15:51	Note 0000002 added (solution)
15:52	Status resolved to closed
15:52	Note 0000003 added (verification and closing note)

Final state

Issue 0000001 has the status **closed** and the resolution **fixed**, with three notes recording the investigation, the fix and the verification.
